

Project: Kazeems Kloud

Domain Link: http://localhost/KhanZoha_CMIS4500_FinalProject/activities/login.php

Student Name: Zoha Khan

Student ID: P124281148

Project Description: Kazeem's Kloud is a baby-tracking website. The website allows the user (parent/guardian) to track everything that has to do with the child like naps, feedings, diaper changes, and playtime. The child's doctor can also access the information if needed. The purpose of the website is to remove the need of keeping tracking of all these child related activities when there are already many other things going on.

How to create database: A create_tables.sql was provided, but I would create the database in phpmyadmin homepage by importing the kazeems_kloud database. (also provided in the folder)

http://localhost/KhanZoha_CMIS4500_FinalProject/activities/login.php

Using the link provided, it should take you to the home screen, where you can enter either of the credentials below to access the homepage:

LOGINS:

For User:

Username: zoha

Password: 123

For Doctor:

Username: doc

Password: 123

Note: To see the report, select November 24th as the starting date, since that is when I started entering input values

Files Submitted:

INC Folder -

db_connect.php - to connect to the database kazeems_kloud

Activities folder -

index.php - php code for the homepage, all the queries

login.php - php code, login page for the user to enter their username/password to access the homepage
